Oracle packs: the proposed set

The 9 products we have (5 rows; 3 more share their engines) and 6 new (5 packs, 1 service), within the cap of 8 new. Together they cover the distinct uses of AI Data Platform and Oracle Cloud (OCI) + NVIDIA, all six mini-site groups and Oracle's four priority laser campaigns.

WHAT AIDP IS USED FOR

- **A. Why did the number move.** A CFO asks why company revenue, cost or margin missed budget; an agent ranks the causes in finance data and proposes an action. Pack: P&L variance analysis.
- **B. Agents that prepare fixes in the ERP.** Agents watch E-Business Suite for held invoices, late orders and slow stock and prepare each fix for approval. Pack: EBS exception agents.
- **C. Answers and fields from documents.** Questions over contracts and policies in cloud storage, answered with the page cited; key fields pulled into tables. Packs: Document Q&A, Large docs.
- **D. One consistent data layer.** Old warehouses and other databases linked or copied into AI Lakehouse so every report gives the same number: step one of Business metrics Q&A. Moves off Databricks: per deal.
- **E. Predictions for every customer or product.** Machine-learning scores on lakehouse data: who will leave, what will sell. Pack: Customer churn and retention.

WHAT OCI + NVIDIA (NEMO, BLUEPRINTS) IS USED FOR

- **1. Cited research across many sources.** A multi-step investigation across documents and systems, written up as a cited report (NVIDIA AI-Q blueprint). Packs: Plan vs actual, Account insights, Case evidence collection.
- **2. Document-to-record extraction.** Fields from long documents loaded into a system, each linked to its page (NeMo Retriever). Pack: Large docs.
- **3. Video and image understanding.** Events found in footage, damage judged from photos (NVIDIA video search blueprint, Cosmos Reason vision model). Pack: Repair-or-replace.
- **4. Customer agents by voice.** A caller talks to an agent that answers and completes simple requests (Nemotron speech; NVIDIA's blueprint is still a developer example). Pack: the voice tier of Customer service agent.
- **5. Own tuned models instead of a paid AI service.** An open model tuned on the company's own traffic gives the same answers for less (NeMo Customizer, NIM). Service: AI running-cost reduction.

Case 3 runs on NVIDIA's video stack, not NeMo. Route and roster planning (NVIDIA cuOpt, also not NeMo) runs on OCI GPUs too: Workforce and Fleet.

HOW ORACLE POSITIONS AIDP

Oracle draws AIDP in four layers: company data where it sits; a business map of it (ontology); a workbench to build agents, plus its own analyst agent (Deep Insights) and action agents with a person approving; then answers in chat, workflows and apps. It sells an outcome to the CFO: a demo on sample data in 2-3 days, production in 4-5 weeks, deals of $1M+.

WHAT AN AIDP PACK IS

Where Oracle ships the agent (Deep Insights, EBS agents), our pack is the demo kit (questions, sample data, expected answers, the money case) plus the rollout; we build only where Oracle ships nothing. OCI packs are our own software, mostly on NVIDIA blueprints. Oracle asks us not to combine NVIDIA GPU work with AIDP yet, so no pack mixes the two.

LASER CAMPAIGNS

Oracle aims 13 laser campaigns at EMEA accounts by what they run (L = AI Lakehouse, A = AIDP, O = OCI AI; figure = accounts). Priority: L1 Lakehouse (225), A1 E-Business Suite (123), O1 Digital Assistant (70), O3 AI running cost (189+), each with a row below. Our 22 Sep segment proposals are rows 2, 3, 4, 8 and 11.

MINI-SITE GROUPS

All six get a pack: knowledge & analytics, deep research, documents, transactions & processes (empty today, now two), forecasting & optimization, video & image.

WHAT WE KEEP

All nine stay; six head a row (row 1 holds both metrics Q&A listings). Three reuse an engine: Account insights (news turned into sales openings) and Case evidence collection (a cited file per complaint), AI-Q like row 6; Fleet route optimization (today's van routes), cuOpt like row 9. Not proposed: demand forecasting (churn's scoring covers it), a data-migration pack.

WHICH PACK GETS THE REQUEST

- "What is the number?": Business metrics Q&A. "Why did company margin miss budget?": P&L variance. "Why did this project overrun?": Plan vs actual.
- A quick answer quoted from files: Document Q&A. A cited report across files and systems: an AI-Q pack. The same fields from every file, loaded into a system: Large docs.
- Staff fixing ERP transactions: EBS exception agents. Outside customers by chat or voice: Customer service agent. A working AI app that costs too much per request: AI running-cost reduction.
- Who will cancel, judged from their own billing and usage: Churn. Which outside news opens a sale at an account: Account insights.

NOTES

- Not on general sale yet: Oracle's Deep Insights agent (whitelisted tenancies only) and the EBS agent templates (due to partners mid-October; the agent list is still owed). Until then P&L variance and EBS exception agents are built per deal.
- Oracle's partner leads (16 Sep) advised against AIDP customer packages for now; its AIDP strategy lead (29 Sep) wants us on its top deals. Confirm with Oracle that AIDP packs are wanted before building any ahead of a deal.
- Services, not packs: AI running-cost reduction (check first with Oracle's OCI AI team, which sells model hosting itself); data moves (L2 warehouses, L4 pipelines, L5 Exadata) are the way into row 1, through the AI Lakehouse Quick Start; Sovereign AI (O2, 197 accounts) is a deployment option on any OCI row.

THE PROPOSED SET: 5 WE HAVE, 6 NEW

#	PACK · BUILT ON	PROBLEM IT SOLVES	WHAT WE DELIVER	SITE GROUP · LASER CAMPAIGN
ORACLE AI DATA PLATFORM (AIDP) AND AI LAKEHOUSE				
1	**Business metrics Q&A + Cross-system ERP Q&A** HAVE AI Lakehouse: Select AI over metric views and links to ERP and CRM databases	Managers wait a week for the data team to answer a question across finance and sales (margin by region, overdue invoices), so decisions slip and numbers disagree.	Each metric is defined once over the databases the company already runs, linked in place or copied once. Anyone asks in plain words and gets the same number in minutes.	**Enterprise knowledge & analytics** L1 Lakehouse (225, priority) · L3 Oracle DB (168) · A3 Fusion (215)
2	**Document Q&A** NEW AIDP agent flow with a RAG knowledge base over OCI Object Storage files; no GPUs	Legal and compliance staff read contracts one by one to answer one question (can we exit this supplier early?), spending hours per answer and replying late to auditors.	Documents already in cloud storage are indexed. Staff ask in plain words, see only folders they are cleared for, and get the answer with the clause quoted: minutes, not hours.	**Enterprise knowledge & analytics** A5 Unstructured data (238, the largest)
3	**P&L variance analysis** NEW Oracle's Deep Insights agent on AIDP over Fusion (EBS to confirm) finance data; we map the data	When revenue, cost or margin misses budget, the CFO waits two weeks for analysts to explain why, and the loss keeps running for another month.	Oracle's analyst agent reads the finance and operations data, ranks the causes of each miss, cites the records and proposes an action for sign-off: an answer in a day.	**Deep research & investigation** A2 Fusion Data Intelligence (144) · A4 Oracle Analytics (123)
4	**EBS exception agents** NEW Oracle's EBS agent templates on AIDP over EBS data (path to confirm); a person approves each fix	Finance and supply teams on E-Business Suite find held invoices, late orders and slow-moving stock too late, so the month-end close drags and cash sits in the warehouse.	Oracle's agents (list due mid-October) flag each case and prepare the fix for approval: release the invoice, expedite the order, clear slow stock. Faster close, less cash in stock.	**Transaction & process execution** A1 E-Business Suite (123, priority)
5	**Customer churn and retention** NEW AIDP notebooks: a churn model on billing, usage and service data, each score with its drivers	A telco, utility or software firm learns a customer is leaving only when they cancel, so it pays blanket discounts to customers who would have stayed and still loses revenue.	Every customer is scored weekly for risk of leaving, with the reason and the cheapest fitting offer, tested against a control group. Retention spend goes where it keeps revenue.	**Forecasting & optimization** None; Oracle doesn't lead with it. Upsell in L1 and A3 accounts
OCI AI SERVICES + NVIDIA (NEMO, BLUEPRINTS, CUOPT)				
6	**Plan vs actual investigation** HAVE NVIDIA AI-Q agent on OCI GPUs, also behind Account insights and Case evidence collection	A construction or engineering project ends over budget or late, and project controllers cannot trace which work packages caused it, so the next bid repeats the loss.	An agent reads the schedule, cost ledger and contract letters and shows where each work package overran, why, and the record behind it, before the next bid is priced.	**Deep research & investigation** None; sold through our own deals
7	**Large docs processing and review** HAVE · EXTEND NVIDIA NeMo Retriever on OCI GPUs; extension: a no-GPU AIDP edition for A5	Operations staff type rates and terms from 40-page contracts into the ERP by hand, so each contract takes days to load and a wrong rate turns into an overpaid invoice.	Rates, terms and renewal dates come out of each contract linked to their page, and a reviewer confirms them before they load. No retyping; wrong rates caught before payment.	**Document processing** A5 (238) via the AIDP edition; else our own deals
8	**Customer service agent** NEW Oracle Digital Assistant + OCI Generative AI agent linked to booking or billing; NVIDIA voice later	Customers who chat or call hit a scripted assistant that fails off-script and then queue for a person, so every routine request (a rebooking, an address change) costs staff time.	The Oracle assistant gets an agent that answers from policies and the customer's account, completes agreed requests (a rebooking), hands the rest to staff. Cost per contact falls.	**Transaction & process execution** O1 Digital Assistant (70, priority)
9	**Workforce optimization** HAVE NVIDIA cuOpt on OCI GPUs, linked to Oracle Field Service; same engine as Fleet route optimization	Dispatchers build technicians' plans by hand around skills, absences and zones, so workloads come out uneven and the same headcount completes fewer paid jobs a day.	Planning software linked to Oracle Field Service builds a four-week technician plan in minutes, balanced across zones with less driving: more jobs per technician a day.	**Forecasting & optimization** A3 Fusion (215), Field Service users
10	**Repair-or-replace decisions** HAVE NVIDIA video search blueprint (VSS) and Cosmos Reason model on OCI GPUs, plus repair rules	Claims and repair teams judge repair or replace by eye from photos of damaged vehicles or equipment, so needless replacements get paid and crews return twice.	Software measures damage in each photo or video, checks the repair rules and proposes repair or replace, quoting the rule; a person confirms. Fewer needless replacements and repeat visits.	**Video & image intelligence** None; sold through our own deals
11	**AI running-cost reduction** NEW · SERVICE Nemotron tuned with NeMo; served by OCI Generative AI (to confirm) or NVIDIA NIM on OCI	A company's AI apps pay an outside model provider for every request and send it company data, so the bill grows with every user and the data leaves its control.	One app at a time moves to an open NVIDIA model in the company's own Oracle cloud, tuned until its answers match on a test set. Cost per request is measured before and after.	**Service, outside the six groups** O3 AI running cost (189+, priority)
