Oracle packs: the proposed set

5 packs we have and 6 new (5 packs, 1 service), under the cap of 8. Together they cover the distinct uses of AI Data Platform and OCI + NVIDIA, all six mini-site groups and Oracle's four priority laser campaigns.

WHAT AIDP IS USED FOR

- **A. Why did the number move.** A CFO asks why revenue, cost or margin missed plan; an agent ranks the causes in company data and proposes an action. Pack: P&L variance analysis.
- **B. Agents that prepare fixes in the ERP.** Agents watch E-Business Suite for held invoices, late orders and slow stock and prepare each fix for approval. Pack: EBS exception agents.
- **C. Answers and fields from documents.** Questions over contracts and policies in cloud storage, answered with the page cited; key fields pulled into tables. Packs: Document Q&A, Large docs.
- **D. One consistent data layer.** Scattered data (other clouds, old warehouses, Databricks) linked or moved so every report gives the same number. The first step of the Q&A pack, not a pack of its own.
- **E. Predictions for every customer or product.** Machine-learning scores on lakehouse data: who will leave, what will sell. Pack: Customer churn and retention.

WHAT OCI + NVIDIA NEMO IS USED FOR

- **1. Cited research across many sources.** One question over documents and systems, answered as a cited report (AI-Q blueprint). Packs: Plan vs actual, Account insights, Case evidence collection.
- **2. Document-to-record extraction.** Fields from long documents loaded into a system, each linked to its page (NeMo Retriever). Pack: Large docs.
- **3. Video and image understanding.** Events found in footage, damage judged from photos (VSS blueprint, NVIDIA vision models). Pack: Repair-or-replace.
- **4. Customer agents by chat and voice.** An agent that understands the caller, answers and completes simple requests (Nemotron speech, NeMo Guardrails). Pack: Customer service agent.
- **5. Own tuned models instead of a paid AI service.** An open model tuned on the company's own traffic gives the same answers for less (NeMo Customizer, NIM). Service: AI running-cost reduction.

Route and roster optimization (cuOpt) carries the same site tag but is not NeMo: Workforce and Fleet.

HOW AIDP SEES ITSELF

Oracle draws AIDP in four layers: company data where it sits, a business map of it (ontology), its own analyst agent (Deep Insights) and action agents with a person approving, then answers in chat, workflows and apps. It sells an outcome to the CFO: a demo on sample data in 2-3 days, production in 4-5 weeks, deals of $1M+.

WHAT AN AIDP PACK IS

Where Oracle ships the agent (Deep Insights, EBS agents), our pack is the demo kit (questions, sample data, expected answers, the money case) plus the rollout; we build only where Oracle ships nothing. NVIDIA packs are our own software on NVIDIA blueprints. The two never share a deployment.

LASER CAMPAIGNS

Oracle aims 13 laser campaigns at EMEA accounts by what they already run (L = AI Lakehouse, A = AIDP, O = OCI AI; figure = accounts). Priority: L1 Lakehouse (225), A1 E-Business Suite (123), O1 Digital Assistant (70), O3 AI running cost (189+). Each has a pack below, and all five apps from our 22 Sep segment analysis are placed.

MINI-SITE CATEGORIES

All six groups get a pack. Transaction & process execution, empty today, gets two.

WHAT WE KEEP

All nine site products stay. Six head a row (the two Q&A listings share one). Three sit under the row with the same engine: Account insights and Case evidence collection (AI-Q, like Plan vs actual) and Fleet route optimization (cuOpt, like Workforce, but today's van routes). Left out: demand forecasting, a stand-alone data-migration pack.

WHICH PACK GETS THE REQUEST

- "What is the number?" goes to the Q&A pack; "why did company margin miss budget?" to P&L variance; "why did this project overrun?" to Plan vs actual.
- One question answered from documents: Document Q&A. The same fields from every document, loaded into a system: Large docs.
- Staff fixing ERP transactions: EBS exception agents. Outside customers by chat or voice: Customer service agent.
- A customer at risk, judged from its own billing and usage: Churn. An account hit by outside news: Account insights.

NOTES

- Not on general sale yet: Oracle's Deep Insights agent (whitelisted tenancies only) and the EBS agent templates (due to partners mid-October; the agent list is still owed). Until then both AIDP agent packs are built per deal.
- Oracle's partner leads (16 Sep) said no AIDP customer packages yet; its AIDP strategy lead (29 Sep) asked us to take the top opportunities. Settle this before building AIDP packs in advance.
- Services, not packs: AI running-cost reduction (check first with Oracle's OCI AI team, which sells model hosting itself); data moves for L2, L4, L5 run through the AI Lakehouse Quick Start; Sovereign AI (O2) is a deployment option on any NVIDIA pack.

THE PROPOSED SET: 5 WE HAVE, 6 NEW

#	PACK · BUILT ON	PROBLEM IT SOLVES	WHAT WE DELIVER	SITE GROUP · LASER CAMPAIGN
ORACLE AI DATA PLATFORM (AIDP) AND AI LAKEHOUSE				
1	**Business metrics Q&A + Cross-system ERP Q&A** HAVE AI Lakehouse: Select AI over metric views and links to ERP and CRM databases	A manager's question across finance and sales (margin by region, customers with overdue invoices) waits a week for the data team, and departments report different numbers.	Each metric is defined once over the databases the company already runs, linked in place or copied once. Anyone asks in plain words and gets the same number in minutes.	**Enterprise knowledge & analytics** L1 (225, priority) · L3 (168) · A3 (215); entry for L2, L4, L5
2	**Document Q&A** NEW AIDP agent flow (Oracle's search samples) over files in OCI Object Storage; no GPUs	Legal and compliance staff read contracts one by one to answer one question (can we exit this supplier early?), spending hours per answer and replying late to auditors.	Documents already in cloud storage are indexed. Staff ask in plain words, see only folders they are cleared for, and get the answer with the clause quoted: minutes, not hours.	**Enterprise knowledge & analytics** A5 Unstructured data (238, the largest)
3	**P&L variance analysis** NEW Oracle's Deep Insights agent on AIDP over Fusion finance data; we map the data and questions	When revenue, cost or margin misses budget, the CFO waits two weeks for analysts to explain why, and the loss keeps running for another month.	Oracle's analyst agent reads the finance and operations data, ranks the causes of each miss, cites the records and proposes an action for sign-off: an answer in a day.	**Deep research & investigation** A2 FDI (144) · A4 Oracle Analytics (123)
4	**EBS exception agents** NEW Oracle's EBS agent templates on AIDP over a copy of EBS data; a person approves each fix	Finance and supply teams on E-Business Suite find held invoices, late orders and slow-moving stock too late, so the month-end close drags and cash sits in the warehouse.	Oracle's agents flag each case daily and prepare the fix for approval: release the invoice, expedite the order, discount the stock. The close finishes sooner; less cash sits in stock.	**Transaction & process execution** A1 E-Business Suite (123, priority)
5	**Customer churn and retention** NEW AIDP notebooks score billing, usage and service data; Deep Insights explains the drivers	A telco, utility or software firm learns a customer is leaving only when they cancel, so it pays blanket discounts to customers who would have stayed and still loses revenue.	Every customer is scored weekly for risk of leaving, with the reason and the cheapest fitting offer, tested against a control group. Retention spend goes where it keeps revenue.	**Forecasting & optimization** None of its own; sold into L1 and A3
OCI AI + NVIDIA (NEMO AND ITS BLUEPRINTS)				
6	**Plan vs actual investigation** HAVE NVIDIA AI-Q research agent on OCI GPUs over schedules, cost ledgers and contract letters	A construction or engineering project ends over budget or late, and project controllers cannot trace which work packages caused it, so the next bid repeats the loss.	An agent reads the schedule, the cost ledger and the contract letters and shows where each work package overran, why, and the record behind it, before the next bid is priced.	**Deep research & investigation** None; our own pipeline
7	**Large docs processing and review** HAVE · EXTEND NVIDIA NeMo Retriever on OCI GPUs; proposed no-GPU AIDP edition for A5 deals	Operations staff type rates and terms from 40-page contracts into the ERP by hand, so each contract takes days to load and a wrong rate turns into an overpaid invoice.	Rates, terms and renewal dates come out of each contract linked to their page, and a reviewer confirms them before they load. No retyping; wrong rates are caught before payment.	**Document processing** A5 (238) via the AIDP edition; else our own pipeline
8	**Customer service agent** NEW Oracle Digital Assistant + OCI Generative AI agent linked to booking or billing; NVIDIA voice later	Customers who chat or call hit a scripted assistant that fails off-script and then queue for a person, so every routine request (a rebooking, an address change) costs staff time.	The existing Oracle assistant gets an agent that answers from policies and the customer's account, completes agreed requests such as a rebooking and hands the rest to staff. Cost per contact falls.	**Transaction & process execution** O1 Digital Assistant (70, priority)
9	**Workforce optimization** HAVE NVIDIA cuOpt on OCI GPUs; plans in and out of Oracle Fusion Field Service	Dispatchers build technicians' plans by hand around skills, absences and zones, so workloads come out uneven and the same headcount completes fewer paid jobs a day.	Planning software linked to Oracle Field Service builds a four-week technician plan in minutes, balanced across zones with less driving. Each technician completes more jobs a day.	**Forecasting & optimization** A3 Fusion (215), Field Service users
10	**Repair-or-replace decisions** HAVE NVIDIA VSS blueprint on OCI GPUs, a damage-measuring model and the repair rules	Claims handlers and technicians judge repair or replace by eye from photos of damaged vehicles and equipment, so insurers fund needless replacements and crews make repeat visits.	Software measures the damage in each photo or video, checks the repair rules and proposes repair or replace, quoting the rule; a person confirms. Fewer needless replacements, fewer repeat visits.	**Video & image intelligence** None; our own pipeline
11	**AI running-cost reduction** NEW · SERVICE Open NVIDIA model (Nemotron) tuned with NeMo on the client's own traffic, served on OCI	A company's AI apps pay an outside model provider for every request and send it company data, so the bill grows with every user and the data leaves its control.	One app at a time moves to an open NVIDIA model in the company's own Oracle cloud, tuned until its answers match on a test set. Cost per request is measured before and after.	**Service, outside the six groups** O3 (189+, priority) · O2 Sovereign (197)
